Company Overview

Exyn Technologies is an autonomous robotics and geospatial intelligence company developing advanced software that enables drones, robots, and other autonomous systems to navigate, map, and collect high-value data in complex, GPS-denied environments. Built on its proprietary ExynAI autonomy platform, the Company delivers industrial-grade autonomous navigation and real-time 3D mapping solutions for customers across mining, infrastructure, construction, geospatial, and defense markets.

Having proven its technology through thousands of real-world autonomous missions, Exyn is expanding beyond its established mining business into larger, high-growth markets through a platform-agnostic software and OEM licensing strategy. With autonomous data collection increasingly critical to industrial digitization, digital twin creation, and defense applications, Exyn is positioned at the intersection of several rapidly growing markets driving demand for advanced robotics, autonomy, and geospatial intelligence solutions.

Investment Highlights

Proprietary Autonomous Navigation Platform with Strong Technology Moat

- Proprietary Level 4B autonomy platform capable of autonomous navigation, mapping, and data collection in GPS-denied, communications-denied, and previously unknown environments
- ExynAI enables drones and robotic systems to autonomously generate mission plans, navigate complex environments, and create survey-grade 3D digital twins without relying on external infrastructure
- Six years of real-world deployments and over 1,000 autonomous missions per month, creating a substantial operational data and engineering advantage
- Platform-agnostic architecture allows its software to operate across multiple aerial and ground robotic systems, expanding its addressable market and reducing dependence on any single hardware platform

Positioned at the Intersection of Multiple High-Growth Technology Markets

- Exyn operates at the convergence of autonomous robotics, digital twins, LiDAR, geospatial intelligence, industrial automation, and defense technologies
- Addressable markets exceed \$70 billion and are supported by long-term secular trends including industrial digitization, infrastructure modernization, and increasing adoption of autonomous systems

Transitioning Toward a Scalable, High-Margin Software Business Model

- Evolving from a primarily hardware-driven business toward a software-centric model through API, SDK, and OEM licensing offerings
- Software can be integrated into third-party drones, robots, and autonomous systems, creating recurring licensing opportunities independent of hardware sales
- Software and OEM deployments have the potential to drive higher margins, improve scalability, and expand recurring revenue visibility over time
- Recently launched ExynAI SDK significantly broadens the Company's commercial opportunities by enabling autonomous navigation and mapping capabilities across third-party platforms

Proven Commercial Adoption Across Global Industrial Customers

- Exyn's technology is deployed by leading mining operators and industrial customers worldwide, including organizations operating some of the world's most complex and challenging environments
- Customers utilize Exyn's solutions for mission-critical applications where autonomous data collection can reduce survey times from weeks to hours while improving safety and operational efficiency
- Established a growing customer base spanning mining, geospatial, construction, infrastructure, and industrial inspection markets
- Exyn's technology is embedded within customer workflows, creating strong customer retention and opportunities for expansion within existing accounts

Expanding Government and Defense Opportunity

- Autonomous navigation capabilities are uniquely suited for military and government applications due to their ability to operate in GPS-denied, contested, and communications-limited environments
- Pursuing opportunities across intelligence, surveillance, reconnaissance (ISR), tactical mapping, infrastructure inspection, and industrial defense applications Growing customer/partner base enhances access to government and enterprise infrastructure opportunities globally
- Exyn's Range subsidiary provides a dedicated platform for pursuing defense and government contracts while leveraging the Company's proven commercial technology base
- Defense represents a significant long-term growth vector as autonomous systems become increasingly important to modern military operations

Experienced Leadership Team Driving Commercial Expansion

- Leadership team combines deep expertise across autonomous systems, robotics, aerospace, defense, software commercialization, and public company operations
- Management has successfully built, scaled, and exited technology businesses while leading commercialization efforts within major industrial and defense organizations

Why Does The Customer Care?

Capture Accurate Datasets, Anywhere

- Self-contained autonomy, resilient to loss of GPS or communications
- Operators can safely explore complex, dangerous environments using Level 4B autonomy
- Flexible, modular platform that replaces multiple separate systems

EXYN

Value Proposition

Exyn Technologies is emerging as a differentiated autonomy software and geospatial intelligence platform positioned at the intersection of several powerful technology trends, including autonomous robotics, digital twins, industrial automation, geospatial intelligence, and defense modernization. As industries increasingly seek to digitize physical assets and automate hazardous, labor-intensive workflows, demand is growing for autonomous systems capable of collecting accurate data in complex, GPS-denied, and communications-limited environments. Exyn's proprietary ExynAI platform addresses this need by enabling drones, robots, and autonomous systems to navigate, map, and collect high-value data without relying on existing infrastructure, creating a significant competitive advantage in environments where conventional autonomous systems cannot operate effectively.

The Company has spent more than six years validating its technology in demanding real-world applications, establishing a leadership position in underground mining while building a foundation for expansion into larger and faster-growing markets, including geospatial surveying, infrastructure inspection, construction, energy, and defense. Unlike many emerging autonomy companies still focused on technology development, Exyn has demonstrated commercial adoption across a growing base of industrial customers that rely on its solutions for mission-critical operations. The Company's platform has been proven through thousands of autonomous missions, creating a substantial technology moat built on operational experience, proprietary software, and continuous real-world data collection.

Importantly, Exyn is evolving beyond a hardware-centric business model toward a more scalable software-driven strategy through OEM partnerships, API integrations, and software licensing opportunities. The introduction of the ExynAI SDK enables third-party drone and robotics manufacturers to integrate Exyn's autonomy capabilities directly into their platforms, expanding the Company's addressable market while creating the potential for recurring, higher-margin software revenue streams. This transition positions Exyn to participate in the broader growth of autonomous systems without being constrained by hardware deployments alone.

At the same time, growing defense and government demand for autonomous systems capable of operating in contested, GPS-denied environments creates an additional avenue for long-term growth. Exyn's proven capabilities in autonomous navigation, tactical mapping, and real-time situational awareness are highly aligned with emerging military requirements, providing exposure to a potentially significant new market opportunity. With a differentiated technology platform, expanding commercial adoption, increasing software monetization opportunities, and exposure to multiple large and growing end markets, Exyn is positioned to capitalize on the accelerating adoption of autonomous data collection and intelligent robotics across both commercial and government sectors.
