Company Overview

ASP Isotopes is an advanced materials company transitioning from development into commercial production of high-value isotopes and critical gases. The Company employs its proprietary Aerodynamic Separation Process (ASP) and Quantum Enrichment technology to produce and commercialize isotopes essential to healthcare, semiconductors, and clean energy. ASPI has commenced commercial output of Silicon-28, Carbon-14, and Ytterbium-176 at its South African facilities, with additional isotope programs underway. Through strategic partnerships, including TerraPower, ASPI is advancing High Assay Low Enriched Uranium (HALEU) supply for next-generation nuclear reactors, while its joint venture with Fermi America provides a U.S. base for stable isotope and nuclear fuel production. With the completed acquisition of Renegen, ASPI has expanded into helium and natural gas production, positioning the combined company as a vertically integrated global provider of critical isotopes and materials serving high-growth markets including semiconductors, quantum computing, and clean energy.

Investment Highlights

Game-changing strategic partnerships and agreements

- Signed definitive agreements with TerraPower (founded by Bill Gates) to finance and supply up to 150 MT of HALEU over 10 years, beginning 2028; supports Natrium SMR project.
- Entered joint venture with Fermi America (co-founded by former U.S. Energy Secretary Rick Perry) to build a HALEU enrichment facility at the IIGW HyperGrid campus in Texas, alongside a 100% ASPI-owned stable isotope production plant.
- Entered MOU with Necsa to co-develop nuclear fuel facilities at Pelindaba, South Africa.
- Strategic investment in IsoBio, Inc., advancing antibody-isotope conjugates (AICs™) for cancer therapy, supported by ASPI's isotope supply chain.

Commercial production milestones achieved and accelerating

- Silicon-28: Commercial production commenced March 2025; largest customer order to date secured with U.S. delivery expected Q1 2026, validating commercial-scale demand.
- Carbon-14 / Carbon-12: Enrichment underway with initial shipments completed in 2025.
- Ytterbium-176: Quantum Enrichment facility commissioned; commercial samples shipped to customers beginning August 2025.
- Three enrichment facilities now operational in South Africa, marking ASPI's transition from R&D to revenue-generating operations.

Transformational acquisition expands ASPI into helium and critical gases

- Completed acquisition of Renegen, creating a vertically integrated critical materials company spanning isotopes, helium, and natural gas; expansion supported by up to \$750 million of committed debt financing, including funding from the U.S. Development Finance Corporation (DFC), materially de-risking scale-up and growth.
- Virginia Gas Project positions ASPI as a future global supplier of liquid helium, a strategically critical input for semiconductors, quantum computing, aerospace, and medical imaging.

Expanding pipeline and multiple value-creation levers

- Preparing construction of additional Quantum Enrichment facilities targeting Nickel-64, Gadolinium-160, and Lithium-6/7, addressing acute Western shortages across radiotherapy, imaging, fusion, and advanced nuclear applications.
- Quantum Leap Energy advancing regulatory pathways in the UK for HALEU production and pursuing laser enrichment scale-up, with a planned future spinout to unlock shareholder value.

Massive market demand aligned with geopolitical tailwinds

- Global HALEU demand valued at \$37B+ through 2037; ASPI engaged with multiple SMR developers and governments.
- Structural shortages of isotopes such as Silicon-28, Ytterbium-176, Nickel-64, and Lithium-6/7, historically dependent on Russia and China.
- Helium markets experiencing supply constraints amid rising demand from semiconductors, AI infrastructure, and quantum technologies.

Highly experienced leadership with execution track record

- Paul Mann (CEO/Chairman): former Soros, Highbridge, and Morgan Stanley; co-founder of ASPI.
- Deep technical bench across isotope enrichment, nuclear fuels, and industrial scale-up, complemented by newly integrated Renegen operating team.

Value Proposition

ASPI is emerging as a category-defining platform in the global critical materials and isotope supply chain, having transitioned from development to early commercialization in 2025. With multiple operating enrichment facilities in South Africa, the Company is now shipping Silicon-28, Carbon-12/Carbon-14, and Ytterbium-176—each supporting high-value applications across semiconductors, nuclear medicine, and clean energy. These milestones validate ASPI's proprietary Aerodynamic Separation Process (ASP) and Quantum Enrichment technologies and demonstrate their scalability into repeatable commercial production.

The Company's strategic partnerships and industrial relationships provide uncommon market access and long-duration visibility. Definitive agreements with TerraPower include secured financing and a multi-year HALEU supply framework, positioning ASPI as a cornerstone supplier to next-generation nuclear reactor deployments. The joint venture with Fermi America establishes a U.S. footprint for stable isotope and nuclear fuel production at a strategically pre-qualified site, aligning ASPI with the buildout of advanced energy and data infrastructure in the United States.

The completed acquisition of Renergen meaningfully expands ASPI's addressable market and strategic relevance. By integrating Renergen's helium production and natural gas operations, ASPI has evolved into a vertically integrated critical materials provider spanning isotopes and electronic gases. Helium is an increasingly scarce and strategically vital input for semiconductors, quantum computing, aerospace, and medical imaging, and Renergen's Virginia Gas Project—supported by up to \$750 million of committed, U.S. DFC-backed project financing—provides a clear, de-risked pathway to scale. The combination diversifies revenue streams, enhances cash flow potential, and strengthens ASPI's position within Western-controlled supply chains.

Looking ahead, ASPI is advancing additional Quantum Enrichment facilities targeting Nickel-64, Gadolinium-160, and Lithium-6/7—materials facing acute Western shortages and serving multi-billion-dollar end markets in radiotherapy, imaging, fusion, and advanced nuclear energy. In parallel, Quantum Leap Energy continues to progress regulatory engagement in the UK and capital formation initiatives supporting laser enrichment and HALEU production, with a planned future separation intended to unlock incremental shareholder value while sharpening ASPI's focus on medical, semiconductor, and industrial isotopes.

Supported by proven technology, visible execution milestones, and powerful geopolitical tailwinds favoring secure domestic supply of critical materials, ASPI represents one of the few independent platforms capable of serving multiple high-growth sectors at scale. For investors, the Company offers a differentiated risk-reward profile defined by early commercial traction, diversified long-term growth vectors, and strategic positioning at the intersection of healthcare innovation, quantum computing, advanced nuclear energy, and electronic materials.

Upcoming Milestones

- Fulfill all initial commercial contracts of Silicon-28 in 1H 2026.
- Ytterbium-176 customer validation and Ytterbium-176 commercial contract fulfillment in 1H 2026.
- Begin Construction of Iceland facilities, US facilities, and UK facilities in 2026 with a goal of enriching isotopes in the US and UK in 2026.
- Goal to begin new global plant construction including Xe-129, Gd-160, Ni-64, and Zn-68 plants by the end of 2026.
- Continue our expansion of the global radiopharmaceutical strategy into new markets.
- Execute separate listing of QLE on NASDAQ.
