Phase 3 FLAMINGO-01 Data Presented. Greenwich LifeSciences and the FLAMINGO-01 Steering Committee made two presentations at the American Association of Cancer Research (AACR) 2026 Meeting. One detailed the FLAMINGO-01 trial design while the other presented preliminary results from delayed-type hypersensitivity (DTH) response data showing a statistically significant immune response.

First Poster Presentation Included DTH Data. As discussed in [our Research Note on March 18](#), the company announced a preliminary analysis of recurrence rates in the non-HLA-A*02 arm. Immune responses to GP2 were measured using Delayed-Type Hypersensitivity (DTH) skin tests at baseline, then after 4 or 6 months. This open-label arm of the trial has enrolled about 250 patients, with data reported for 191 patients who completed the six-monthly doses of GLSI-100 at four-month or six-month evaluation points.

Initial Results. Prior to GLSI-100 administration, 5.2% of the population showed a DTH reaction at baseline. This increased to 20.4% of the patients in month 4 or month 6, or approximately 290% (4X). This increased incidence of DTH reactions was statistically significant, supporting the mechanism of action and predicting a reduction in recurrence and prevention of metastatic breast cancer ($p < 0.001$).

We See This Data As Confirmation Of The Mechanism Of Action. The DTH immune response indicates the immune system has recognized the GP2 antigen and has been activated to recognize and destroy recurring cancer cells that display it on their surface. This response could potentially kill the cancer cells. Thus far, data from the open-label arm are trending similarly to the Phase 2b trial, indicating that GLSI-100 may be effective across all HLA types.

Conclusion. The new DTH data are consistent with our expectations and indicate that the immune response to the GP2 peptide is effective. As patient screening and enrollment continue in the double-blind arms, we look forward to the results of the interim analysis to assess the strength of GLSI-100 and prospects for a successful Phase 3 trial. We are reiterating our Outperform rating and \$45 price target.

FLAMINGO-01 Data Presented. Greenwich LifeSciences and the FLAMINGO-01 Steering Committee made two presentations at the American Association of Cancer Research (AACR) 2026 Meeting. The first detailed the FLAMINGO-01 trial design, and the second presented preliminary results from delayed-type hypersensitivity (DTH) response data, showing statistically significant immune responses, with subgroup analyses by HLA types.

Background on The Phase 3 FLAMINGO-01 Trial Design. The Phase 3 FLAMINGO-01 trial is a prospective study (NCT05232916) testing GLSI-100 for the prevention of metastatic or recurrent breast cancer. GLSI-100 contains a 9-amino acid peptide sequence of the HER2/neu protein known as GP2, given in combination with Granulocyte-Macrophage Colony Stimulating Factor (GM-CSF). This combination stimulates an immune response to GP2 that targets cancer cells bearing the HER2/neu protein on their surface.

Target enrollment is about 500 patients at about 160 sites in the US and Europe. Eligible patients have been diagnosed with HER2-positive breast cancer, followed by surgery and 12 months of chemotherapy with anti-HER monoclonal antibody therapy. Upon completion of 12 months post-surgical treatment, patients are tested for HLA type, a genetic characterization that determines potential immune responses.

Patients with the most common HLA type, HLA-A*02, are randomized into the double-blind arms to receive either GLSI-100 or a placebo. Approximately 250 patients with other HLA types have been enrolled in a third open-label arm known as "non-HLA-A*02" patients. The preliminary immune response data from patients in the open-label arm were presented at AACR 2026.

Primary Endpoint. The trial has been designed to show a reduction in recurrence or metastasis. To detect a hazard ratio of 0.3 in IDFS, 28 events will be required. An interim analysis for superiority and futility will be conducted when at least half (14) of those events have occurred. The sample size provides 80% power if the annual rate in placebo-treated patients is 2.4% or greater.

Exhibit 1. Schematic Diagram of the Phase 3 FLAMINGO-01 Trial. One of the AACR posters described the design of the Phase 3 FLAMINGO-01 trial. This poster stated that over 1,300 patients have been screened to date. A new protocol amendment to include a non-HLA-A*02 placebo arm is under regulatory review in some countries.

Flamingo-01 - Phase III Trial Schema & Interim Analysis

Exhibit 2. Treatment Plan For Phase 3 FLAMINGO-01. Following surgery, patients receive 12 months of treatment with an anti-HER2 monoclonal antibody (Herceptin, Perjeta, or Kadcylla). After completion, they receive 6 monthly doses of GLSI-100, known as the Primary Immunization Series, PIS. This is followed by boosters at 6-month intervals through month 36.

GP2 Phase III Clinical Trial Dosing

Source: Greenwich LifeSciences, Inc.

First Poster Presentation Included DTH Data. As discussed in [our Research Note on March 18](#), the company announced a preliminary analysis of recurrence rates in the non-HLA-A*02 open-label arm. These patients had completed 6 monthly injections of GLSI-100 (the Primary Immunization Series, PIS) and showed a reduction in recurrence rate of approximately 70-80%.

Initial Results. The AACR presentation included data from 191 out of the 247 patients enrolled in the non-HLA-A*02 open-label arm of the trial. The patients' immune responses to GP2 were measured at baseline before the Primary Immunization Series using Delayed-Type Hypersensitivity (DTH) skin tests. Patients were evaluated again after 4 months or 6 months.

The DTH reaction (redness and/or induration) is an inflammatory response that develops 24 to 72 hours after exposure to an antigen. It is used to assess *in vivo* immune responses and involves a reaction mainly by T cells against a foreign substance. It was used in the trial as an indication of a patient's immune response.

The percentage of patients experiencing a DTH reaction increased significantly between baseline and the 4-month or 6-month time frame. Prior to GLSI-100 administration, 5.2% of the population showed a DTH reaction at baseline. This increased to 20.4% of the patients in month 4 or month 6, or approximately 290%. The increase was statistically significant, supporting the mechanism of action and predicting a reduction in recurrence and prevention of metastatic breast cancer (McNemar, $p < 0.001$).

Each HLA-A type showed increased immune reactivity after treatment with GLSI-100 than at baseline, with frequency increasing from 100% to 700%. These results are summarized in Exhibit 3.

Exhibit 3: DHT Immune Responses To GP2 By HLA Type. DHT responses were seen in all HLA types.

HLA-A Allele Present ¹	Number of Patients ²	Baseline Reaction (Redness) n (%)	Reaction at Month 4 or 6 (Redness) n (%)	% Increase from Baseline to Month 4 or 6
All non-HLA-A*02 ³	191	10 (5.2)	39 (20.4)	290%
HLA-A*01	65	5 (7.7)	18 (27.7)	260%
HLA-A*03	54	1 (1.9)	8 (14.8)	700%
HLA-A*11	29	2 (6.9)	6 (20.7)	200%
HLA-A*24	52	2 (3.8)	8 (15.4)	300%
HLA-A*29	28	2 (7.1)	4 (14.3)	100%
HLA-A*30	16	3 (18.8)	6 (37.5)	100%
HLA-A*68	25	2 (8.0)	6 (24.0)	200%

¹ Patients with at least one allele. Double allele patients are reported once. Patients with 2 different alleles reported twice under each allele.

² Patients with complete paired data (baseline and Month 4 or 6 assessment)

³ Patients without an HLA-A*02 allele treated in open-label arm

Source: S. Patel et al, Preliminary Delayed Type Hypersensitivity Immune Response Results From Open-Label Arm of Ongoing Phase III Study To Evaluate the Efficacy and Safety of GLSI-100 (GP2 + GM-CSF) In Breast Cancer Patients With Residual Disease Or High-Risk PCR After Both Neo-Adjuvant and Postoperative Adjuvant Anti-HER2 therapy, Flamingo-01. AACR 2026.

We See This Data As Confirmation Of The Mechanism Of Action. The DTH response indicates the immune system has recognized the GP2 antigen and has been activated against recurring cancer cells that display it on their surface. Although it is too early to predict the trial outcome, we believe this response could potentially kill the cancer cells. At this time, data from the open-label arm are trending similarly to the Phase 2b trial, indicating that GLSI-100 may be effective across all HLA types.

Conclusion. The new DTH data are consistent with the prior release and with our expectations. The DTH reactions in treated non-HLA-A*02 patients were statistically significant, indicating an immune response to the GP2 peptide. These immune response data support the mechanism of action, predicting a reduction in recurrence and prevention of metastatic breast cancer. This data shows GLSI-100 may be effective in patients across all HLA-A types.

As patient screening and enrollment continue in the double-blind arms, we look forward to the results of the interim analysis to assess the strength of GLSI-100 and prospects for a successful Phase 3 trial. We are reiterating our Outperform rating and \$45 price target.

Company Profile

Company Description. Greenwich LifeSciences is a biotechnology company developing GLSI-100, an immunotherapy to prevent recurrence of breast cancer. GLSI-100 completed four clinical trials before starting the current Phase 3 Flamingo-01 trial. The trial began in January 2023 and is currently enrolling patients in the US and Europe.

Valuation Summary

Our valuation is based on completion of the Phase 3 FLAMINGO-01 trial, followed by market entry by FY2028. We value the stock based on FY2029 EPS of \$9.90 per share. We believe this to be a conservative estimate for the first full year of sales, which could come earlier. Applying a multiple of 15X to the discounted EPS for a target of \$45 per share.

GENERAL DISCLAIMERS

All statements or opinions contained herein that include the words "we", "us", or "our" are solely the responsibility of Noble Capital Markets, Inc. IMPORTANT DISCLOSURES

This publication is confidential for the information of the addressee only and may not be reproduced in whole or in part, copies circulated, or discussed to another party, without the written consent of Noble Capital Markets, Inc. ("Noble"). Noble seeks to update its research as appropriate, but may be unable to do so based upon various regulatory constraints. Research reports are not published at regular intervals; publication times and dates are based upon the analyst's judgement. Noble professionals including traders, salespeople and investment bankers may provide written or oral market commentary, or discuss trading strategies to Noble clients and the Noble proprietary trading desk that reflect opinions that are contrary to the opinions expressed in this research report.

The majority of companies that Noble follows are emerging growth companies. Securities in these companies involve a higher degree of risk and more volatility than the securities of more established companies. The securities discussed in Noble research reports may not be suitable for some investors and as such, investors must take extra care and make their own determination of the appropriateness of an investment based upon risk tolerance, investment objectives and financial status.

Company Specific Disclosures

The following disclosures relate to relationships between Noble and the company (the "Company") covered by the Noble Research Division and referred to in this research report.

The Company in this report is a participant in the Company Sponsored Research Program ("CSR"); Noble receives compensation from the Company for such participation. No part of the CSR compensation was, is, or will be directly or indirectly related to any specific recommendations or views expressed by the analyst in this research report.

Noble intends to seek compensation for investment banking services and non-investment banking services (securities and non-securities related) within the next 3 months.

Noble is not a market maker in the Company.

FUNDAMENTAL ASSESSMENT

The fundamental assessment rating system is designed to provide insights on the company's fundamentals both on a macro level, which incorporates a company's market opportunity and competitive position, and on a micro/company specific level. The micro/company specific attributes include operating & financial leverage, and corporate governance/management. The number of check marks that a company receives is designed to provide a quick reference and easy determination of the company's fundamentals based upon the following five attributes of the company (weighting reflects the importance of each attribute in the overall scoring of company's fundamental analysis):

Attribute	Weighting
Corporate Governance/Management	20%
Market Opportunity Analysis	20%
Competitive Position	20%
Operating Leverage	20%
Financial Leverage	20%

For each attribute, the analysts score the company from a low of zero to a high of ten based upon the analysis described below. The final rating and resulting check marks is a result of dividing the overall score (out of 100%) by ten.

Rating	Score	Checks
Superior	9.1 to 10	Five Checks
Superior	8.1 to 9	Four & A Half Checks
Above Average	7.1 to 8	Four Checks
Above Average	6.1 to 7	Three & A Half Checks
Average	5.1 to 6	Three Checks
Average	4 to 5	Two & A Half Checks
Below Average	3 to 3.9	Two Checks
Below Average	2 to 2.9	One & A Half Checks
Low Quality	0 to 1.9	One Check

While these are the attributes currently used for the analyst's fundamental analysis, the attributes and weighting may be reviewed, updated with additional attributes, and/or changed in the future based on discussions with the analysts and recommendations from the Director of Research.

Following is the description of each attribute in the fundamental analysis.

Corporate Governance/Management

We believe that a review of corporate governance and assessment of the senior management are important tools to determine investment merit. Good corporate governance aligns management with the interests of stakeholders. As such, analysts are to rank the company on the basis of good corporate governance principles that may include rules and procedures, board composition and staggered term limits, rights and responsibilities, corporate objectives, monitoring of actions and policies, and accountability. In addition, analysts will assess issues with controlling shareholders and whether decisions have been made in the past that were in the interests of all shareholders. In addition, management will be assessed based on industry experience, expertise, and/or track record.

High ranking example: Board and management that is aligned with the interests of shareholders with incentives based on stock price appreciation and with an experienced management team known for exceptional shareholder returns.

Low ranking example: Concentrated ownership without independent directors that do not necessarily align with all shareholders' interests.

The Market Opportunity Analysis

In this review, the analyst assesses the company's macro environment as a measure of understanding the industry. Factors considered include the size and growth potential of the industry under various economic conditions, the emerging demands in the market, technological benefits/disruptions, competition, geographical opportunities, and customer demands/needs, and an assessment of supply and distribution channels. In addition, the analyst will review legal and regulatory trends, as well as potential shifts in consumer or social behavior and natural environment changes.

High rank example: A company in an industry that is growing revenues well above GDP rates (which are on average 2% plus) and/or may have unmet or underserved needs in a rapidly growing market opportunity.

Low rank example: A mature industry that is in secular decline and likely to grow below GDP rates.

Competitive Position

The evaluation of the company's competitive position is another macro environment attribute designed to measure the relevance, market share, position and value proposition, and sustainable differentiations of the company and its products/services within its industry. Ease of entry into the industry and the ability of other well-funded players to potentially enter the market would be determined. As such, the assessment would consider the company's strengths and advantages of its products/services against weaknesses and limitations. This may include the company's current brand awareness, pricing and cost structure, current market strategies and geographic penetration that may affect demand for its products/services. In addition, the company's competitors would be evaluated.

High rank example: An analyst would consider the company's product to be superior to its competitors and that should allow the company to gain market share.

Low rank example: A company with a "me-too" product that does not have any significant technology advantages in an industry that has low barriers to entry.

Operating Leverage

Simplistically, operating leverage is determined by the operating income relative to changes in revenue. The analyst will calculate the impact on sensitivity on gross margins and variable costs to determine operating leverage. The analyst will take into account the ability of the company to cut fixed and variable costs in a challenged revenue environment and technological changes that may impact operating expenses. In addition, the analyst is to assess corporate strategies that include capital investment, which may be required for sustainable revenue growth, marketing expenses, and the company's ability to attract and retain talent and/or employees. The analyst should focus on the revenue opportunity and determine the price elasticity of demand for the company's products or services. In other words, the analyst is to rank the company based on improved operating margins going forward on an absolute and relative basis.

High rank example: A company that has improving margins for the foreseeable future, with significant price elasticity.

Low rank example: A company that is in a challenged revenue environment with a fixed cost structure and limited ability to cut costs, indicating an outlook for declining margins.

Financial Leverage

A strict definition of financial leverage is total debt divided by total shareholder's equity. Financial leverage analysis is to determine the company's ability to improve shareholder value by means of utilizing its balance sheet to grow organically or to acquire assets. Analysts may look at the company's debt to cash flow leverage ratio, interest coverage ratios, or debt to equity ratios. In addition, the interest rate environment and the outlook for interest rates are a factor in determining the company's ability to manage financial leverage. Finally, the analyst is expected to determine the ability to service the debt given the industry and/or company profile, such as cyclical, barriers to entry, history of bankruptcy, consistency in revenue and profit growth, or predictability in sales and profits and large cash reserves. The analyst is expected to take into account capital intensity of the company and the anticipated of capital allocation decisions.

High rank example: A company with predictable and growing revenue and cash flow with modest debt levels. This may indicate that the company could improve shareholder value through growth investments, including acquisitions, using debt financing.

Low rank example: A company in a cyclical industry in a late stage economic cycle that has above average debt leverage and is in an industry that has a history of financial challenges, including bankruptcies.
