New Era Energy & Digital (NUAI)

An Early Stage, Strategically Backed, & De-Risked AI Infrastructure Provider

Summary

We are initiating coverage of New Era Energy & Digital, Inc. (NUAI) with an OP rating and an \$11.00 PT. Since formally announcing its pivot into AI infrastructure in August 2025, NUAI has continued to make steady progress and now has all of the right pieces in place to deliver its first lease by fall 2026. Overall, we believe NUAI offers a compelling investment opportunity into an undervalued, de-risked, and "early stage" AI infrastructure provider.

Key Points

1). NUAI's flagship TCDC site (650 MW secured in Ector County, Texas) is in advanced commercial discussions with a top-tier Hyperscaler. This means one of the following: Alphabet, Amazon, Meta, or Microsoft. We view all of these scenarios as extremely positive.

2). The Hyperscaler has organized an arranged marriage for NUAI to form a joint venture with Stream Data Centers (acquired by Apollo for \$40B in November 2025) and an institutional capital partner (we believe to be Apollo) to develop and finance its TCDC campus.

3). NUAI's recent \$290M pre-lease facility with Macquarie Group alongside its \$115M equity raise serves as a meaningful step in cleaning up the balance sheet. The equity raise directly eliminated the SharonAI overhang and provided NUAI with full ownership of the TCDC site, while the Macquarie facility provides staged, project-level capital to fund TCDC development, along with strong institutional validation of NUAI's strategy, management team, and the TCDC site. Note the Macquarie facility requires lease execution within six months.

4). NUAI has built a de-risked execution strategy through a coordinated ecosystem of strategic partners. **Stream Data Centers** brings Hyperscaler relationships and operational execution, while the institutional capital partner is expected to provide equity and arrange ~80% project-level debt financing. On the infrastructure side, **RK Mission Critical** supports modular fabrication and supply chain reliability, **Thunderhead Energy** is responsible for financing and delivering behind-the-meter power, and engineering is led by **Ramboll / EYP Mission Critical Facilities**.

5). NUAI has meaningfully strengthened its execution capabilities through a revamped management team with the appointments of Charles Nelson as President and COO (February 2026) and Ted Warner as CFO (March 2026). Nelson brings deep experience in building and scaling energy and infrastructure platforms, and Warner contributes nearly two decades of capital markets experience, including over \$7B in HPC-related financing.

Investment Thesis

We believe NUAI offers a compelling investment opportunity into an undervalued, de-risked, and "early stage" AI infrastructure provider that is strategically positioned to deliver an initial lease at its flagship TCDC campus by fall 2026. Note on its 4Q25 business update call (March 17th, 2026), management highlighted that TCDC is in advanced commercial discussions with a top-tier Hyperscaler. Management believes, and we agree, that there are essentially four top-tier credit-worthy Hyperscalers: Alphabet Inc. (GOOGL, NR), Amazon.com, Inc. (AMZN, NR), Meta Platforms, Inc. (META, NR), and Microsoft Corporation (MSFT, NR).

Furthermore, on April 1, 2026, NUAI announced a non-binding LOI to form a joint venture with Stream Data Centers and an institutional capital partner to develop and finance its TCDC campus (650 MW secured in Ector County, Texas). Note this was essentially an arranged marriage organized by the Hyperscaler for whom they wanted to work with on the project. Under the proposed structure, NUAI contributes site control and local execution, Stream serves as development manager and operator, bringing a proven track record in large-scale data center delivery with Hyperscalers, and the institutional partner provides equity (roughly 50% or slightly higher) and arranges ~80% project-level debt financing. Note in November 2025, Apollo Global Management (APO, NR) announced that it had completed the acquisition of a majority stake in Stream Data Centers, valuing the company at \$40B. While it has not been confirmed, we expect that Apollo is the Institutional Investor. Overall, we believe this structure de-risks execution at TCDC and represents a key step toward securing a definitive lease, with Stream developing the data center and Apollo financing it.

That said, NUAI remains in an early-stage development phase with limited operating cash flow and significant forward capital requirements tied to its AI infrastructure buildout. However, we view NUAI's recent \$290M project-level facility with Macquarie Group alongside its \$115M equity raise as a meaningful step in cleaning up the balance sheet and addressing near-term liquidity constraints. Prior to these financings, NUAI faced ~\$73.9M of near-term obligations, including \$50M tied to the SharonAI promissory. The equity raise eliminated the SharonAI overhang, cementing NUAI with full ownership of the TCDC site, while the Macquarie facility provides staged, project-level capital to fund TCDC development and removes key funding uncertainties that had raised going concern risk. Note the Macquarie facility requires lease execution within six months. Overall, we view these financings as strong institutional validation of NUAI's strategy, asset quality, and management team.

NUAI has also built a de-risked execution strategy through a coordinated ecosystem of strategic partners. Stream Data Centers brings Hyperscaler relationships and operational execution, while the institutional capital partner is expected to provide equity and arrange ~80% project-level debt financing. On the infrastructure side, RK Mission Critical supports modular fabrication and supply chain reliability, Thunderhead Energy is responsible for financing and delivering behind-the-meter power, and engineering is led by Ramboll / EYP Mission Critical Facilities. Read more about each partner on pages 10 and 11.

Additionally, on February 2, 2026, NUAI appointed Charles Nelson as President and COO, and on March 16, 2026, appointed Ted Warner as CFO, strengthening both operational execution and capital markets capabilities as the company transitions into the buildout phase of its AI infrastructure platform. Nelson brings experience developing and scaling large-scale energy and infrastructure projects, while Warner adds nearly two decades of capital markets experience, including structuring over \$7B in data center and HPC-related financing. We believe both hires are aligned with NUAI's shift toward execution at TCDC, with Nelson focused on operational delivery and Warner leading capital formation and project financing.

Recent Developments

We believe NUA I has made meaningful progress so far in 2026, advancing its transition into a developer and operator of AI infrastructure. Specifically, NUA I has now secured pre-lease financing, gained full ownership of and expanded TCDC, locked in power procurement, formed strategic partnerships, and made recent hires to help with execution, operations, and capital formation. Overall, we believe these developments indicate the platform is transitioning to commercialization with improving execution visibility.

Pre-Lease Financing Secured & Liquidity Concerns Addressed. On April 8, 2026, NUA I announced it closed a multi-tranche senior secured term loan facility of up to \$290M with Macquarie Group to support development of its TCDC campus. Overall, we believe the facility establishes a foundational project financing vehicle for TCDC and represents an important step toward advancing the campus through early-stage development and into construction. Furthermore, on April 9th, NUA I announced the pricing of a \$100M underwritten public offering of ~29.9M shares of common stock at \$3.35 per share, along with a shoe for ~4.5M shares that brought the total raise to ~\$115M. Net proceeds are expected to be used primarily to repay outstanding borrowings under the SharonAI senior secured convertible note (paid April 10th, 2026), along with general corporate purposes. The transaction essentially removed legacy obligations tied to the TCDC buyout while providing incremental liquidity to support ongoing development.

Full Ownership of TCDC and Site Expansion. On December 23rd, 2025, NUA I announced a binding agreement to acquire Sharon AI's remaining 50% interest in Texas Critical Data Centers (TCDC) for \$70M, and on January 16, 2026, the company confirmed the transaction had closed, resulting in 100% ownership of its flagship 650 MW secured / potential 1+ GW AI/HPC campus. The consideration structure included \$10M cash, \$10M deferred equity, and a \$50M senior secured promissory note maturing June 30, 2026, of which \$40M of the principal amount constitutes non-convertible debt, designed to minimize near-term dilution while preserving financing flexibility. The transaction provides NUA I with full control over capital allocation, tenant negotiations, and project timelines. In parallel, NUA I completed the acquisition of an additional 203 acres adjacent to the site, expanding the total campus footprint to ~438 acres and enhancing its ability to support multi-phase, large-scale deployment. Then, on February 26, 2026, NUA I announced a non-binding LOI to acquire ~54 acres adjacent to its TCDC campus, aimed at strengthening site control and advancing ongoing negotiations with a leading Hyperscaler. The additional acreage is intended to enhance NUA I's ability to structure offtake arrangements and reduce exposure to broader grid constraints.

Strategic Partnerships. On April 1, 2026, NUA I announced a non-binding LOI to form a joint venture with Stream Data Centers and an institutional capital partner to develop and finance its TCDC campus. Under the proposed structure, NUA I contributes site control and local execution, Stream serves as development manager and operator, bringing Hyperscaler relationships and a proven track record in large-scale data center delivery, and the institutional partner provides equity and arranges ~80% project-level debt financing. Note Stream Data Centers is a developer and operator of data center colocation capacity for Hyperscaler and enterprise customers. On February 27th, 2026, NUA I announced that its strategic partner Thunderhead Energy has secured the critical generation equipment for the TCDC campus, with initial plans supporting ~450MW of behind-the-meter power capacity. Thunderhead is responsible for financing, constructing, and operating the gas-fired power infrastructure. In February 2026, NUA I also signed an LOI with RK Mission Critical to secure dedicated fabrication capacity supporting its data center development pipeline. The partnership provides NUA I with access to RK's controlled manufacturing facilities, enabling more consistent and timely delivery of critical infrastructure components and reducing supply chain risk.

04/16/2026

NUAI Corporate Timeline

Key Milestones Achieved in 2025	
January	Finalize JV with SharonAI to develop data centers
February	Announce LOI to acquire TCDC site
July	Close on TCDC site acquisition
August	New Era Helium (NEHC) Rebrands as New Era Energy & Digital (NUAI)
September	Announced initial 250 MW behind-the-meter agreement with Thunderhead Signs LOI with Mawgan Capital to deliver proprietary power supply
October	Selects EYP Mission Critical Facilities, for full-scope engineering
November	Enters into land option purchase agreement for 3,500 Acres in New Mexico for ~7GW site Enters into definitive purchase and sale agreement for additional 203 acres at TCDC
December	Entered into a binding agreement to acquire Sharon AI's 50% ownership interest in TCDC

Source: NCM Research

Key Milestones Achieved in 2026	
January	Closed acquisition of remaining 50% of TCDC from Sharon AI
February	Announced appointment of Charlie Nelson as President and COO
	Announced strategic 54-acre corridor LOI adjacent to TCDC
	Announced 450MW behind-the-meter generation plan
	Commercial arrangement with Thunderbird & Turbine-X LOI signed with RK
March	Announced appointment of Ted Warner as Chief Financial Officer
April	Announced JV with Stream and an Institutional Investor for TCDC
	Secured \$290M term loan credit facility with Macquarie for TCDC
	Issues ~\$115M of equity (including shoe) to address going concern risk

TCDC Site Layout and Overview

Source: NUAi 4Q25 Investor Presentation

Flagship AI Infrastructure Campus: Texas Critical Data Centers (TCDC)

NUAI's HPC strategy is anchored by its flagship TCDC campus, a ~438-acre site with a pending 54-acre corridor in Ector County, Texas, designed to support 1+ GW of AI and HPC compute capacity, with 650 MW gross secured currently, through phased development. Located in the Permian Basin, the site benefits from direct access to multiple natural gas pipelines, fiber networks, and CO₂ infrastructure, positioning it as a power-advantaged location capable of delivering lower transmission costs and high reliability. **Note NUAI is in advanced commercial discussions with a top-tier Hyperscaler with initial power delivery at TCDC targeted for 2H27** (potentially by August 2027, but we believe the fall of 2027 is more reasonable).

Initial development at TCDC is expected to begin with a ~200 MW Phase 1 powered-shell deployment leveraging an existing point of interconnection. Subsequent phases (but potentially part of the initial phase) include an additional ~450 MW of integrated power supported by diversified natural gas supply across three pipelines, with generation equipment secured through the Thunderhead partnership. The campus is ultimately designed to scale through phased, demand-driven expansion toward 1+ GW of total capacity via incremental behind-the-meter generation and grid interconnection. Note the site's proximity to existing generation assets and established infrastructure corridors supports a more predictable development pathway, while reducing reliance on constrained grid interconnection timelines that are increasingly limiting new capacity. A core differentiator of the TCDC platform is NUAI's hybrid power strategy, which combines grid interconnection with behind-the-meter natural gas generation. This approach is intended to provide dispatchable, reliable power while mitigating interconnection delays and increasing control over energy delivery. The company is advancing an integrated power development pathway that includes diversified gas supply across multiple pipelines, on-site generation, and potential future integration of storage and other energy assets, aligning with broader industry trends toward "bring your own power" solutions for large-scale AI workloads.

Source: NUAI 4Q25 Investor Presentation

NUAI is also standardizing its development approach through “powered shell” and turnkey delivery models, enabling faster deployment timelines and improved capital efficiency. These structures allow hyperscale tenants to either take control of fitted infrastructure or outsource full buildout and operations, supporting flexibility while improving permitting, procurement, and scalability across phases. NUAI is leveraging a partner-driven execution model, working with engineering, power, and infrastructure specialists to accelerate timelines and reduce execution risk.

The capital structure for TCDC is expected to rely on project-level, non-recourse or limited-recourse financing aligned with contracted cash flows, reflecting strong institutional demand for AI infrastructure assets. NUAI’s ability to execute at scale will depend on securing tenants, advancing to final investment decisions, and maintaining access to capital, but TCDC positions the company within a constrained supply environment where speed-to-power and integrated energy solutions are increasingly critical.

TCDC Energization Timeline and Power Strategy. TCDC is structured as a phased, multi-source energization buildout with: Phase 1 (~200 MW gross / ~133 MW IT*) expected to be delivered in 2H27, sourced from neighboring generation sources (Vistra / Calpine), providing a clear path to initial energization with secured capacity. Phase 2 (~450 MW gross / ~300 MW IT*) is also secured and targeted for 1H28 delivery, with behind-the-meter power sourced through NUAI’s partnership with Thunderhead, structured as a midstream model that limits upfront capital requirements. Phase 3 (~750 MW gross / ~500 MW IT*) represents the potential longer-term expansion of the site, incorporating a hybrid mix of grid interconnection and behind-the-meter generation, with delivery expected in 2028+. Note all IT load numbers are estimated by us using a conservative PUE of 1.5.

TCDC Capex & Equity Requirements. We estimate total build costs of ~\$1.6B, ~\$3.6B, and ~\$6.0B across Phases 1–3, respectively, based on ~\$12M per MW of IT load. Assuming an 80/20 project finance structure, this implies total equity requirements of ~\$320M, ~\$720M, and ~\$1.2B, of which NUAI would contribute ~\$144M, ~\$324M, and ~\$540M across each phase, assuming a ~45% ownership.

TCDC Energization Timeline and Power Strategy			
	Phase 1	Phase 2	Phase 3
Gross Load	200 MW	450 MW	750 MW
IT Load	133 MW	300 MW	500 MW
Source	Vistra / Calpine	Behind-the-Meter	Grid + Behind-the-Meter
Delivery	2H27	1H28	2028+

**Assumes a conservative PUE of 1.5 to calculate IT load*

TCDC Capex & Equity Requirements			
	Phase 1	Phase 2	Phase 3
IT Load	133 MW	300 MW	500 MW
Capex per MW	\$12.0M	\$12.0M	\$12.0M
Total Build Cost	\$1,600M	\$3,600M	\$6,000M
JV Required Equity	\$320M	\$720M	\$1,200M
NUAI Required Equity	\$144M	\$324M	\$540M

**Assumes capex per MW of \$12M, 80 / 20 Project Finance structure, and NUAI putting up 45% of the required equity*

Source: NCM Research

TCDC Commercialization. From a commercialization standpoint, NUAI is prioritizing investment-grade Hyperscalers as anchor tenants for early phases, viewing long-term contracted cash flows as critical to unlocking project-level financing. Over time, the company intends to layer in higher-yield tenants, including GPU cloud providers and sovereign AI platforms, to enhance returns while maintaining a balanced risk profile. Lease structures are expected to be long-term and triple-net, with power costs passed through to tenants, insulating NUAI from commodity exposure and supporting stable, development-driven returns.

Note on its 4Q25 business update call, management highlighted that TCDC is in advanced commercial discussions with a top-tier Hyperscaler customer. Management believes, and we agree, that there are essentially four top-tier credit-worthy Hyperscalers: Alphabet Inc. (GOOGL, NR), Amazon.com, Inc. (AMZN, NR), Meta Platforms, Inc. (META, NR), and Microsoft Corporation (MSFT, NR).

Initial TCDC Lease, Phase 1 Expectations. For Phase 1 capacity, we would expect NUAI to structure a long-term, investment-grade triple-net lease with one of the Big Four Hyperscalers (META, AMZN, MSFT, GOOG), consistent with broader industry frameworks. Based on management commentary, this likely implies a ~15–20-year lease term with pricing calibrated to achieve ~8–10% yield on cost, supporting tighter, more favorable project-level debt financing. Note the triple-net structure shifts operating costs, including power, to the tenant, enabling more stable and predictable cash flows while aligning with institutional capital requirements for long-duration, contracted infrastructure assets.

TCDC Phase 1 Economics, Scenario Analysis. Our scenario analysis for Phase 1 assumes ~133 MW IT load, a 15-year triple-net lease structure (~99% NOI margin) and 45% NUAI ownership at the JV level, with pricing ranging from \$100 to \$160 per kW/month. In our Bear case (\$100), we estimate ~\$160M of annual revenue, ~\$158M of NOI at the asset level, and ~\$71M attributable to NUAI, while our Base case (\$120) implies ~\$192M revenue, ~\$190M NOI, and ~\$85M to NUAI. Our Bull case (\$140) implies ~\$223M revenue, ~\$221M NOI, and ~\$100M to NUAI. Then our Super Bull scenario (\$160) implies ~\$255M revenue, ~\$253M NOI, and ~\$114M to NUAI.

Revenue per kW per Month	Base Revenue	Avg. Annual Revenue	Avg. NOI per Year	
			NNN Lease (~99% Margin)	NUAI Allocation (~45% Ownership)
\$100	\$2.39B	\$160M	\$158M	\$71M
\$105	\$2.51B	\$168M	\$166M	\$75M
\$110	\$2.63B	\$176M	\$174M	\$78M
\$115	\$2.75B	\$184M	\$182M	\$82M
\$120	\$2.87B	\$192M	\$190M	\$85M
\$125	\$2.99B	\$200M	\$198M	\$89M
\$130	\$3.11B	\$207M	\$205M	\$92M
\$135	\$3.23B	\$215M	\$213M	\$96M
\$140	\$3.35B	\$223M	\$221M	\$100M
\$145	\$3.47B	\$231M	\$229M	\$103M
\$150	\$3.59B	\$239M	\$237M	\$107M
\$155	\$3.71B	\$247M	\$245M	\$110M
\$160	\$3.83B	\$255M	\$253M	\$114M

**Assumes TCDC Phase 1 IT Load of 133 MW, 15-Year Base Term, and 45% NUAI Ownership of JV*

AI Infrastructure Pipeline: ~7 GW New Mexico Campus

New Mexico Campus. NUAL is advancing a large-scale development pipeline in Lea County, New Mexico, anchored by a ~3,500-acre site with planned capacity of 7+ GW, representing a significant expansion beyond its initial Permian Basin footprint. The project is structured as NUAL’s first wholly owned development and is expected to be built in phases, with an initial ~2 GW deployment followed by potential expansion toward 7+ GW, positioning the site as a long-term Hyperscale AI infrastructure hub. Initial power delivery is targeted for 2028, subject to development timelines and execution.

The site benefits from favorable infrastructure fundamentals, including proximity to major natural gas pipelines (Kinder Morgan), existing power infrastructure, fiber connectivity, water access, and a skilled local workforce. NUAL has confirmed natural gas availability and is advancing feasibility engineering and site planning, with early-stage tenant discussions underway. These characteristics align with the company’s “powered land” strategy, focusing on securing large-scale, power-advantaged sites capable of supporting accelerated deployment timelines. A key differentiator of the New Mexico campus is its planned hybrid power mix, combining natural gas generation with a longer-term nuclear component. NUAL is partnering with Last Energy to develop 1+ GW of small modular reactor (SMR) capacity, with total nuclear potential exceeding 5 GW over time. This approach is intended to provide scalable, dispatchable, and lower-carbon baseload power, supporting long-duration AI workloads while diversifying the site’s energy profile beyond traditional gas-fired generation.

From a commercialization standpoint, NUAL intends to deploy a similar model to TCDC, offering powered land and powered shell solutions alongside build-to-suit options for hyperscale and AI-focused tenants. The campus is designed to support both large investment-grade Hyperscalers and emerging AI compute platforms, with the scale and power flexibility to accommodate long-term capacity needs. As a wholly owned asset, the project also provides NUAL with greater control over development, capital structuring, and tenant mix relative to its joint venture model. **While the New Mexico litigation remains ongoing, we are not overly concerned given its early-stage status and the independent investigation finding no evidence of wrong doing but expect the litigation to delay any developments in New Mexico for the time being.**

NUAL Pipeline. Management has emphasized that NUAL is building a multi-site development pipeline anchored by TCDC and its 7+ GW New Mexico campus. However, given the size and complexity of the ~7 GW New Mexico project, we expect NUAL to have multiple development sites to emerge and be leased between TCDC and New Mexico. This approach would align with NUAL’s modular, repeatable platform and improve execution pacing while advancing toward multi-GW scale.

Source: NUAL 4Q25 Investor Presentation

Construction and Delivery Strategy

NUAI's development model is centered on a coordinated, partner-led execution strategy designed to accelerate deployment timelines while reducing capital intensity and operational complexity. The company leverages a multi-channel site origination approach, combining behind-the-meter power expertise, energy partnerships, and a curated developer network to access power-advantaged sites that are often unavailable through traditional data center development channels. This sourcing advantage underpins NUAI's broader "speed-to-power" strategy, enabling earlier-stage control of land, power, and infrastructure.

At the core of NUAI's construction approach is a modular, factory-built deployment model, anchored by its partnership with RK Mission Critical. The platform utilizes standardized ~25 MW deployment units that can scale modularly to gigawatt levels, with ~80% of infrastructure components fabricated off-site. This design is intended to reduce on-site labor requirements, improve build consistency, and compress construction timelines. Note dedicated fabrication capacity through RK's controlled facilities further enhances supply chain reliability and mitigates risks associated with long-lead equipment procurement.

Execution is then supported by a fully integrated ecosystem of specialized partners across the project lifecycle. Engineering and design are led by Ramboll and EYP, providing mission-critical facility design, power integration, and commissioning capabilities. Power infrastructure is delivered through partners like Thunderhead Energy, who are expected to finance, construct, and operate on-site generation assets. Additional partnerships across sustainability (Mawgan Capital) and connectivity (GlobeLink) ensure that each campus is delivered with integrated energy, carbon management, and high-capacity fiber infrastructure. By allocating site-level responsibility for power infrastructure to specialized partners, NUAI reduces execution risk and capital burden while ensuring tenants receive reliable, scalable energy supply. This approach also enables parallel development of power and compute infrastructure, eliminating key bottlenecks that typically delay large-scale data center deployments.

NUAI's platform is designed to be repeatable and scalable across projects, with standardized "powered shell" and turnkey delivery frameworks that streamline permitting, procurement, and construction. Each successive deployment is intended to benefit from prior execution, improving speed, cost efficiency, and delivery certainty over time. This repeatability is critical to scaling multi-gigawatt campuses in a constrained supply environment where timelines and execution reliability are key differentiators.

Overall, we believe NUAI's construction and delivery strategy reflects a vertically coordinated, capital-efficient model that combines modular design, strategic partnerships, and integrated power solutions. The ability to execute across parallel workstreams—power, fabrication, and site development—positions the company to accelerate deployment timelines and meet Hyperscaler demand for large-scale, power-secured AI infrastructure.

See an overview of NUAI's strategic partnerships on the next page...

Strategic Partnerships

JV Partnership with Stream to Advance TCDC Development. On April 1, 2026, NUAL announced a non-binding LOI to form a joint venture with Stream Data Centers and an institutional capital partner to develop and finance its TCDC campus. Under the proposed structure, NUAL contributes site control and local execution, Stream serves as development manager and operator, bringing Hyperscaler relationships and a proven track record in large-scale data center delivery, and the institutional partner provides equity and arranges ~80% project-level debt financing. Note this provides NUAL with the right to co-invest significant equity capital alongside the Institutional Investor, making NUAL a meaningful stakeholder in the venture, not merely a land seller, positioning the company to participate in long-term cash flow generation from TCDC. Overall, the structure further de-risks execution at TCDC and represents a key step toward commercialization and securing a definitive tenant agreement. Stream Data Centers is a developer and operator of wholesale data center colocation capacity and build-to-suit facilities for Hyperscaler and enterprise customers. Note on November 3, 2025, Apollo Global Management (APO, NR) announced that Apollo-managed funds completed the acquisition of a majority stake in Stream Data Centers, while Stream's existing management team retained equity ownership and will continue to operate the business. While it has not been confirmed, we expect that Apollo is the Institutional Investor with "experience in digital infrastructure and energy investments, and a track record of providing large-scale financing solutions for complex infrastructure projects."

Manufacturing Partnership. In February 2026, NUAL signed an LOI with RK Mission Critical to secure dedicated fabrication capacity supporting its data center development pipeline. The partnership provides NUAL with access to RK's controlled manufacturing facilities, enabling more consistent and timely delivery of critical infrastructure components and reducing supply chain risk. The relationship is expected to enhance delivery reliability through vertically integrated manufacturing capabilities, aligning with NUAL's broader strategy to de-risk construction timelines and accelerate speed-to-power for hyperscale deployments. RK brings nearly 65 years of experience executing complex, mission-critical infrastructure projects, supporting NUAL's ability to scale development with greater execution certainty.

Behind-the-Meter Power Partners at TCDC. On February 27th, 2026, NUAL announced that its strategic partner, Thunderhead Energy, entered into a commercial arrangement with Turbine-X Energy to secure critical generation equipment for the TCDC campus, with initial plans supporting ~450MW of behind-the-meter power capacity. Under the framework, Thunderhead is responsible for power infrastructure development and procurement, while Turbine-X facilitates access to key generation equipment through OEM relationships, positioning the project to remain on schedule as parties work toward definitive purchase agreements. This development aligns with the Trump administration's Ratepayer Protection Pledge, which promotes a "bring your own power" model requiring large-scale data center operators to secure dedicated, private power solutions, reducing incremental strain on the public grid and end consumers. Management highlighted that securing long-lead power equipment de-risks execution, particularly around supply chain and construction timing, without requiring direct capital outlay from NUAL.

This builds on NUAL's prior agreement with Thunderhead to deploy ~250MW of behind-the-meter generation at TCDC under a non-binding term sheet, where Thunderhead is responsible for financing, constructing, and operating the gas-fired power infrastructure. The initial power island, utilizing a mix of reciprocating engines and turbines, is intended to serve as the core energy backbone for the campus, with construction timelines aligned to support phased data center deployment.

Engineering Partner for TCDC. On October 30th, 2025, NUAL announced that it partnered with EYP Mission Critical Facilities, part of Ramboll Group, to lead full-scope engineering and design for its TCDC campus. Under the partnership, EYP MCF will oversee site engineering, facility design, powered shell development, and electrical systems integration across on-site generation and grid connectivity. The partnership advances project execution by bringing specialized engineering capabilities required for high-performance AI workloads and supports TCDC’s vertically integrated “powered land and shells” model, enabling scalable deployment and improved time-to-market for Hyperscaler tenants.

Fiber Infrastructure Partner to Enable Hyperscale Connectivity. On September 17th, 2025, NUAL announced that it signed an MOU with GlobeLink to develop a 1,600-mile high-capacity fiber network across Texas, designed to support AI, hyperscale, and cloud workloads. Under the framework, GlobeLink will lead development of the fiber network, leveraging Dense Wavelength Division Multiplexing (DWDM) technology to deliver scalable capacity and redundancy, while integrating TCDC into a broader regional and cross-border connectivity backbone. Management highlighted that access to dedicated, high-performance fiber is critical to supporting large-scale AI deployments and Hyperscaler requirements, enabling direct connectivity with high bandwidth and low-latency performance.

Decarbonized Power Partner to Support Behind-the-Meter Strategy. On September 10th, 2025, NUAL announced that it signed a non-binding LOI with Mawgan Capital to deploy its Digital Zero Power (DZP) solution, a behind-the-meter natural gas-based generation platform designed to deliver low-carbon, verifiable energy for AI/HPC workloads. Under the framework, Mawgan will finance and deliver the power solution, leveraging its DZP platform and Context Labs’ carbon management system to quantify and validate emissions, while supporting reliable, on-site energy delivery. Management highlighted that the structure enhances sustainability credentials without compromising power reliability, reinforcing NUAL’s “bring your own power” model for hyperscale tenants.

Delivery Ecosystem

World-class strategic partnerships across the full project lifecycle expected to enable faster scaling, broader expertise, and consistent quality from concept through deployment.

Design & Engineering

Designed in collaboration with EYP & Ramboll

- ✓ **Engineering Precision**
The combination of EYP/ Ramboll's design expertise and RK Mission Critical's manufacturing aims to ensure we meet exact engineering specifications.
- ✓ **Unmatched Expertise**
EYP/Ramboll bring decades of data center design experience to the ATOM platform.
- ✓ **Massive Portfolio**
EYP/Ramboll have designed more than 75 million square feet of data centers worldwide.

Manufacturing

Strategic partnership with RK Mission Critical

- ✓ **Dedicated Fabrication Capacity**
Our partnership with RK Mission Critical allows New Era to have qualified production capacity in their controlled manufacturing facilities, which helps to ensure consistent timely supply for our needs.
- ✓ **Proven Track Record**
With nearly 65 years in business, RK Mission Critical has experience executing on complex data center projects, bringing unparalleled experience to our partnership.
- ✓ **Delivery Guarantee**
This collaboration is expected to help us reliably deliver on our promises, backed by RK Mission Critical's vertically integrated manufacturing capabilities.

Project Finance Strategy

NUAI's development strategy is underpinned by a project-level financing approach designed to support large-scale AI infrastructure buildout while limiting parent-level balance sheet risk. With total TCDC capex expected to exceed \$15B, the company intends to finance projects primarily at the asset level through structured partnerships with institutional capital providers, including infrastructure funds, pension funds, insurance companies, and banks. These investors and the market are increasingly targeting contracted, power-secured data center assets with long-duration, investment-grade counterparties, aligning with NUAI's tenant strategy.

Each data center development is expected to be structured as a standalone special purpose vehicle (SPV), with NUAI acting as sponsor, developer, and asset manager (General Partner), while third-party institutional investors provide the majority of capital as Limited Partners. This structure enables NUAI to scale its platform across multiple projects while minimizing equity dilution at the corporate level. Importantly, NUAI retains the ability to co-invest at the asset level, often contributing land or development value, allowing it to participate in upside alongside LP capital while preserving ownership concentration. At the project level, financing is expected to consist of non-recourse or limited-recourse debt facilities sized to contracted cash flows, combined with equity capital raised directly into each SPV. These structures are designed to align with tenant lease agreements, incorporating hedging strategies, construction-period support, and customary collateral packages tied to project assets. By ring-fencing each project's capital structure, NUAI isolates development and operational risks, avoids cross-collateralization, and protects the parent company's balance sheet.

NUAI's leasing model further supports financing by emphasizing long-term, triple-net agreements with tenants, where operating costs, including power, are passed through directly. This structure enhances cash flow visibility, reduces commodity exposure, and improves the bankability of projects, which is critical for attracting low-cost institutional capital. The combination of contracted revenue streams, standardized delivery models, and investment-grade tenant focus is intended to facilitate efficient capital formation and enable repeatable scaling across its development pipeline. Overall, NUAI's financing strategy reflects a sponsor-led, partnership-driven model designed to match the capital intensity of hyperscale AI infrastructure with institutional capital demand. Execution will depend on securing anchor tenants, achieving key development milestones, and maintaining access to project-level financing, but the structure provides a pathway to scale a multi-GW platform while limiting corporate-level risk.

Institutional Capital Partner. Recall on April 1, 2026, NUAI announced a non-binding LOI to form a joint venture with Stream Data Centers and an institutional capital partner to develop and finance its TCDC campus. Under the proposed structure, NUAI contributes site control and local execution, Stream serves as development manager and operator bringing Hyperscaler relationships and a proven track record in large-scale data center delivery, and the institutional partner provides equity (roughly 50% or slightly higher) and arranges ~80% project-level debt financing. Note this provides NUAI with the right to co-invest significant equity capital alongside the Institutional Investor, making NUAI a meaningful stakeholder in the venture, not merely a land seller, positioning the company to participate in long-term cash flow generation from TCDC. Overall, the structure further de-risks execution at TCDC and represents a key step toward commercialization and securing a definitive tenant agreement. While it has not been confirmed, we expect that Apollo is the Institutional Investor with "experience in digital infrastructure and energy investments, and a track record of providing large-scale financing solutions for complex infrastructure projects."

HPC Capex and Lease Economics Trending Upwards

Demand for power and AI infrastructure is accelerating rapidly, driven by a need for sustained growth in AI and high-performance computing workloads. At the same time, supply remains constrained, with limited availability of power-secured, deliverable hyperscale capacity and prolonged grid interconnection timelines. This imbalance is shifting preference toward power ready sites and behind-the-meter solutions that offer greater speed, certainty, and scalability. As a result, Hyperscalers are increasingly prioritizing control over power and deployment timelines, supporting a step-function increase in capex spend to secure infrastructure at scale. As this imbalance grows, value accrues to those who control energy and compute infrastructure.

We believe NUA1 is strategically positioned as lease rates continue to reprice higher while Hyperscalers compete for power, with current deals commanding more favorable terms than those signed 6 months ago. The latest series of hyperscale leasing announcements underscores an accelerating pricing power as demand for HPC and AI capacity continues to outpace available infrastructure. Notably across deals from CIFR (OP), WULF (OP), APLD (OP), and recently HUT (OP), contract pricing has firmly moved into the \$140–\$190 per kW per month range, with several transactions printing at the top end of the curve. Notably, WULF's October 28th agreement with Fluidstack/Google reached \$188/kW/month, the highest rate among recent disclosed leases and a reflection of urgency from Hyperscalers looking to secure power. *Below, we have provided an overview of the revenue per kW per month of the recent leases signed in the HPC infrastructure universe.*

Date	Ticker	Counterparty	City / Site	State	Critical IT Load	Base Term	Base Revenue	Revenue per Month	Revenue per MW per Month	Revenue per kW per Month
1/16/2026	RIOT	AMD	Rockdale	Texas	25 MW	10 Years	\$0.3B	\$2.6M	\$104K	\$104

Source: NCM Research

Note on its 4Q25 business update call, management highlighted that TCDC is in advanced commercial discussions with a top-tier Hyperscaler customer. Management believes, and we agree, that there are essentially four top-tier credit-worthy Hyperscalers: Alphabet Inc. (GOOGL, NR), Amazon.com, Inc. (AMZN, NR), Meta Platforms, Inc. (META, NR), and Microsoft Corporation (MSFT, NR). Two of the top Hyperscalers (GOOG and AMZN) provided very bullish guidance for 2026 capex, both calling out the spending as being driven by intense customer demand. On February 4th, Alphabet Inc. (GOOGL, NR) reported its 4Q25 results and provided 2026 capex guidance of \$175B to \$185B in order to "meet customer demand and capitalize on the growing opportunities" primarily related to AI investments and infrastructure needed for Gemini. Then on February 5th, Amazon.com, Inc. (AMZN, NR) reported its 4Q25 results and provided 2026 capex guidance of \$200B "predominantly in AWS because we have very high demand, customers really want AWS for core and AI workloads, and we're monetizing capacity as fast as we can install it." *See the next page for an overview of Hyperscaler capex spend from 2023 through 2028 consensus estimates, and as a % of FCFFO.*

Balance Sheet & Liquidity

Balance Sheet Cleaned Up and Near-Term Obligations Addressed. NUAL remains in an early-stage development phase with limited operating cash flow and significant forward capital requirements tied to its AI infrastructure buildout. Note the company's capital needs are substantial, with total development capex for its data center platform expected to exceed \$15B over time, including up to ~\$300M in spend in 2026. That said, we view NUAL's recent \$290M project-level facility with Macquarie Group alongside its \$115M equity raise as a meaningful step in cleaning up the balance sheet and addressing near-term liquidity constraints. Prior to these financings, NUAL faced ~\$73.9M of near-term obligations, including ~\$9.85M due by March 31, 2026, up to \$50M tied to the SharonAI promissory note due June 30, 2026 (paid on April 10th), ~\$10M of G&A, and ~\$3.9M of additional costs. The equity raise directly eliminates the SharonAI overhang, while the Macquarie facility provides staged, project-level capital to fund TCDC development, collectively removing key funding uncertainties that had raised going concern risk.

Beyond balance sheet improvement, we view these financings as strong institutional validation of NUAL's strategy, asset quality, and management team. The involvement of Macquarie at the project level, alongside participation from public equity markets, suggests growing confidence in NUAL's ability to secure a Hyperscaler lease and execute on TCDC. This is further reinforced by NUAL's recent partnership with Stream Data Centers, alongside backing from an institutional capital partner (which we expect to be Apollo Global Management), providing additional validation from experienced operators and large-scale infrastructure investors. Taken together, the capital structure is now more aligned with a scalable GP/LP model, and these partnerships strengthen our confidence in NUAL's ability to secure a Hyperscaler lease and execute on TCDC at scale. As of December 31, 2025, NUAL had \$1.2M of cash and \$2.5M of working capital, alongside net losses of ~\$29.6M for FY25. Management had indicated that liquidity prior to the recent financings was insufficient to fund operations over the next twelve months, raising doubts about NUAL's ability to continue as a going concern absent the new additional capital.

Macquarie Pre-Lease Project Financing for TCDC. On April 8, 2026, NUAL announced it closed a multi-tranche senior secured term loan facility of up to \$290M with Macquarie Group to support the development of its TCDC campus. The facility is structured at the project level through Texas Critical Data Centers LLC and includes \$90M of initial committed tranches and a \$200M delayed draw component, providing staged capital aligned with development milestones and maturing three years from closing. Proceeds will be used to fund site acquisition, development, and construction-related activities, as well as general corporate purposes, reinforcing NUAL's asset-level financing strategy. The agreement also includes a \$5M equity investment and associated warrants from Macquarie at a premium to market, signaling institutional support. Overall, we believe the facility establishes a foundational project financing vehicle for TCDC and represents an important step toward advancing the campus through early-stage development and into construction. NUAL's \$290M senior secured term loan with Macquarie Group is structured as a multi-tranche, project-level facility at the TCDC SPV, consisting of \$20M (A-1), \$30M (A-2), \$40M (A-3), and a \$200M delayed draw tranche, with availability beyond the initial \$20M subject to lender discretion and milestone-based conditions. The facility matures in April 2029 and carries pricing of SOFR + 5.5% for the initial tranches (A-1 and A-2) and SOFR + 7.75% for later-stage and delayed draw capital, reflecting a step-up in cost as capital is deployed deeper into the development cycle. Proceeds from the initial A-1 tranche are allocated toward general corporate purposes, including refinancing existing obligations and transaction costs, while subsequent tranches are earmarked for TCDC development, including site improvements, equipment procurement, and broader construction-related expenditures. The agreement also includes a structured

MOIC-based repayment premium (ranging from ~1.10x to 1.35x depending on timing and tranche), which is fully earned at signing and payable upon repayment, alongside customary covenants and a first-priority lien on substantially all project assets. Importantly, the facility embeds execution-linked requirements, including a mandated equity raise within 60 days of at least \$30M and a lease execution milestone within six months. Failure to meet these thresholds allows the lender to accelerate repayment or enforce structured amortization. Overall, the structure reflects typical early-stage infrastructure financing, with a higher cost of capital and tighter controls, while providing NUA I with flexible, staged funding aligned to project development and commercialization progress.

Tranche	Amount	Interest Rate	MOIC	Primary Purpose
Term Loan A-1	\$20M	SOFR + 5.50%	1.15x – 1.35x	Initial pre-lease development
Term Loan A-2	\$30M	SOFR + 5.50%	1.15x – 1.35x	Pre-lease development
Term Loan A-3	\$40M	SOFR + 7.75%	1.10x – 1.25x	Post-lease development
Delayed Draw Term Loan	\$200M	SOFR + 7.75%	1.10x – 1.25x	Construction funding for TCDC buildout

Source: NCM Research

Equity Raise to Strengthen Balance Sheet. On April 9, 2026, NUA I announced the pricing of a \$100M underwritten public offering of ~29.9M shares of common stock at \$3.35 per share, with \$15M of additional proceeds through a 30-day greenshoe option. Net proceeds are expected to be used primarily to repay outstanding borrowings under the Sharon AI senior secured convertible note, with any remaining capital allocated toward general corporate purposes. The transaction simplifies the capital structure by removing legacy obligations tied to the TCDC buyout while providing incremental liquidity to support ongoing development. While modestly dilutive, the raise positions NUA I with improved financial flexibility as it advances TCDC and broader infrastructure initiatives.

Sharon AI Joint Venture. NUA I initially partnered with Sharon AI in January 2025 to form TCDC as a 50/50 joint venture focused on developing and operating a 250MW energy-integrated AI data center campus in Texas. Under the structure, Sharon AI contributed HPC and data center expertise, while NUA I provided power infrastructure and site development capabilities, aligning around a vertically integrated “power + compute” model. However, in January 2026, NUA I acquired Sharon AI’s remaining 50% interest for \$70M, consisting of \$10M cash, \$10M in equity, and a \$50M secured convertible note, bringing TCDC fully in-house. Overall, the transaction simplifies the ownership structure and provides NUA I with full control over development, financing, and customer engagement, positioning the company to more directly execute on its AI infrastructure strategy.

\$50M Convertible Note Issued as Part of Sharon AI Buyout. As part of the acquisition, NUA I issued a \$50M senior secured convertible note to Sharon AI, maturing June 30, 2026 (paid April 10th), with a 10% cash-pay interest rate. The note is secured by NUA I’s ownership and underlying assets of TCDC and allows for conversion of up to 20% of principal into equity at a price based on the 30-day VWAP, subject to a floor tied to 20% of the closing share price at signing (implying a maximum issuance of ~11.5M shares). Total consideration remains subject to a 19.99% ownership cap.

\$350M Shelf Registration. On January 23rd, 2026, NUA I filed a \$350M shelf registration (effective January 30, 2026), providing the company with the ability to issue equity, debt, or other securities opportunistically based on market conditions and funding needs. The registration is intended to support ongoing capital formation as NUA I advances its data center development strategy. In March and February 2026, NUA I raised ~\$6.6M through the issuance of ~3.3M shares via warrant exercises at \$2.00 per share.

Legacy Operations

Rebranding Reflects Strategic Pivot to AI Infrastructure. On August 12th, 2025, NUAL announced its rebrand from New Era Helium to New Era Energy & Digital, Inc., transitioning away from its legacy E&P operations to focus on developing energy-integrated AI and HPC data center infrastructure. The shift formalizes the company’s strategy to build a vertically integrated platform centered on “powered land” and “powered shells,” combining behind-the-meter power generation with data center development to accelerate speed-to-power for hyperscale customers. While legacy natural gas and helium assets remain part of the portfolio, management has indicated these will be monetized as the company prioritizes AI infrastructure as its primary growth driver.

Legacy E&P Operations and Financial Profile. Prior to its transition toward AI infrastructure, NUAL operated as a single-segment exploration and production company focused on natural gas, natural gas liquids (NGLs), and helium production in Southeast New Mexico. Operationally, NUAL’s legacy model relied on processor-based agreements (solely with Cimmaron Midstream), which continues on a month-to-month basis. However, management has indicated an intention to explore the sale of all or substantially all legacy assets, positioning the portfolio as a source of potential liquidity rather than a long-term operating focus, with capital redeployed toward the company’s energy-integrated AI infrastructure strategy. NUAL controls ~137,000 acres in Chaves County with ~15.1 Bcfe of proved reserves, sourcing helium as a byproduct of natural gas extraction, though notably generating no revenue from helium under existing processing agreements. Operations are supported through third-party processors, with natural gas and associated liquids sold at index-based pricing, and revenue recognized at the point of delivery. Following the divestiture of its oil assets in 2024, NUAL’s revenue base is now fully concentrated in natural gas and NGLs. For FY25, the company generated ~\$0.9M of total net revenue, up from ~\$0.5M in FY24, primarily driven by improved realized natural gas pricing (+\$0.41/Mcf), with only modest volume growth. Net natural gas revenue increased to ~\$0.6M, representing ~73% of total revenue, while NGL revenue declined slightly to ~\$0.24M due to lower realized pricing despite higher volumes. Revenue remains highly dependent on commodity pricing and processing economics, with limited scale and margin visibility.

NCM Valuation. As of December 31, NUAL reported oil and natural gas properties, net of ~\$3.3M, and proved developed oil and natural gas reserves of \$15.1M. While current financial contribution remains minimal (~\$0.9M of FY25 revenue with limited profitability), our valuation work suggests the portfolio could be monetized in the ~\$25–50M range, with downside closer to ~\$10–20M and upside toward ~\$50–75M, depending on buyer interest and acreage quality. The disconnect between book value and estimated market value is primarily driven by the embedded optionality of ~137,000 acres and ~15.1 Bcfe of proved reserves in the Permian Basin, which are not fully reflected on the balance sheet. Overall, we view a potential divestiture as a modest but meaningful source of liquidity that could exceed stated book value and further support NUAL’s transition toward a pure-play AI infrastructure platform.

Valuation Metric	Low Case	Base Case	High Case
Acreage Value (137K acres)	\$14M (\$100/acre)	\$34M (\$250/acre)	\$69M (\$500/acre)
Reserves Value (15.1 Bcfe)	\$5M (\$0.30/Mcfe)	\$10M (\$0.65/Mcfe)	\$15M (\$1.00/Mcfe)
Implied Total Value	\$19M	\$44M	\$84M

New Mexico Litigation

New Mexico Litigation and Potential Impact. On December 23, 2025, the state of New Mexico filed a civil lawsuit against NUAL, certain affiliates, and CEO E. Will Gray II, alleging multiple claims, including violations of the New Mexico Oil and Gas Act, fraud-related statutes, unjust enrichment, and civil conspiracy. The complaint centers on allegations that the company plugged, abandoned, and reclaimed numerous oil and gas wells owned by Acacia Resources, LLC in the state of New Mexico. The case is currently in its early stages and has been stayed due to unrelated bankruptcy proceedings involving other defendants, with no clear timeline for resolution.

NUAL has disputed the allegations and initiated an internal investigation led by independent board members and external counsel, which reviewed documentation and conducted interviews across relevant parties. Management has stated that the investigation found no evidence supporting the claims outlined in the lawsuit or related short-seller reports. The company has indicated it intends to defend against the claims, maintaining that the allegations are not reflective of its operations or conduct.

From a financial and operational standpoint, the ultimate impact of the litigation remains uncertain. NUAL may incur material legal expenses over time and could face potential damages or settlement costs, though the magnitude cannot currently be estimated. Additionally, the ongoing litigation may delay or complicate the company's ability to monetize its legacy oil and gas assets, which are otherwise viewed as a potential source of liquidity as NUAL transitions toward its digital infrastructure strategy.

While management has emphasized that the assets referenced in the lawsuit are non-core and immaterial to its forward strategy, the case introduces incremental risk related to capital allocation, management focus, and balance sheet flexibility. An adverse outcome could impact liquidity, delay asset sales, or create additional financial obligations, though the timing and probability of such outcomes remain unclear given the early stage of proceedings.

NCM Response. While the New Mexico litigation remains ongoing, we are not overly concerned given its early-stage status and the independent investigation finding no evidence of wrongdoing. Importantly, the recent involvement of Stream Data Centers, and potentially Apollo Global Management at the capital level, suggests that institutional counterparties have conducted their own diligence and remain comfortable backing both the project and management team. We will continue to monitor the situation closely, but are comforted by the growing validation from strategic partners as NUAL advances TCDC toward commercialization.

We expect NUAL to prioritize resolving the ongoing New Mexico litigation before pursuing strategic alternatives for its legacy E&P business. As clarity is established, we would anticipate updates on both the legal process and potential monetization of legacy assets. In our view, management will likely aim to have a defined path for both the lawsuit and a potential divestiture in place ahead of an initial TCDC lease announcement, which we believe could occur by fall 2026.

Continue on the next page to see an overview of our estimates and valuation of NUAL...

Our Estimates

We believe our near-term estimates are not a meaningful proxy for NUAL's intrinsic value, given the number of moving pieces that remain to be finalized and how results will ultimately be reported. As such, near-term financials should be viewed as transitional and not reflective of the long-term earnings power of the platform. That said, for FY26 we forecast ~\$0.4M of revenue (entirely from legacy operations), ~\$31.1M of operating expenses, and (\$27.7M) of Adj. EBITDA. For FY27, we forecast ~\$21.9M of revenue, including ~\$21.6M from initial HPC lease contributions tied to ~133 MW of Phase 1 capacity coming online October 1, 2027, alongside (\$30.5M) of adj. EBITDA on ~\$59.2M of operating expenses. By FY28, as the platform begins to scale, we forecast ~\$155.4M of revenue and ~\$76.5M of adj. EBITDA, driven by a full year of Phase 1 capacity generating revenue, half of Phase 2 capacity (~150 MW) beginning to generate revenue mid-2Q28, and the other half of Phase 2 capacity (~150) generating revenue solely in December 2028, with operating expenses of ~\$97.6M.

Overall, we view these estimates as illustrative only, with actual results likely to differ materially depending on how the JV structure, ownership, and reporting are ultimately finalized. We believe the best proxy for NUAL's long-term earnings power and intrinsic value is reflected in our valuation framework.

NUI Valuation

Given NUAL's transition toward a multi-phase, large-scale AI infrastructure platform, we believe a staged HPC valuation framework is appropriate, with value ascribed to capacity ramping in late 2027 and throughout 2028. While we estimate the full TCDC buildout could potentially throw off ~933 MW of capacity by 2030 (~\$1.17B of Adj. EBITDA and ~\$22.2B of EV at a 19.0x multiple), our valuation only credits ~283 MW of capacity, representing ~133 MW from phase 1 by 2H27, and ~150 MW from phase 2 (half of the 450 MW of gross behind-the-meter capacity secured from Thunderhead) by 1H28. Recall we estimate NUAL will own ~45% of the JV at TCDC.

Using the 283 MW of credited capacity, we estimate ~\$354M of Adj. EBITDA (based on \$125M per 100 MW) and apply a 19.0x EV multiple, deriving ~\$6.7B of enterprise value. After subtracting ~\$2.7B of project-level debt and adding ~\$202M of cash flow from operations, we estimate ~\$4.2B of total equity value, with NUAL's ~45% ownership translating to ~\$1.9B of attributable equity. Discounting this back at an 11.0% WACC over ~3 years results in a present value of ~\$1.38B, or ~\$11.07 per share (assuming 125M fully diluted shares outstanding), which forms the basis of our price target.

Overall, we believe this framework embeds conservatism, as we exclude half of the secured capacity from Thunderhead (150 MW IT / 225 MW gross), all of Phase 3 capacity (500 MW IT / 750 MW gross) and NUAL's broader pipeline opportunities.

Based on recent transaction data and public market valuations, we believe our ~19x multiple is appropriately conservative. Private market transactions in the sector continue to support premium valuations for scaled and strategically positioned data center platforms. For example, Prime Data Centers and Stream Data Centers are both believed to have been valued at around 25x NOI, reflecting the strong demand from institutional capital for hyperscale and wholesale assets. On the public side, large-cap REIT peers such as Digital Realty Trust (DLR, NR), Equinix (EQIX, NR), and Vertiv (VRT, NR) currently trade in the 19–29x adj. EBITDA range.

TCDC Phase 1 Floor Valuation

Valuation Framework. We believe a fair and proper way to calculate the intrinsic value of contracted AI Infrastructure capacity is to take the avg. NOI over the course of the lease and apply a very conservative 15x valuation multiple. We then deduct current project finance net debt and divide by fully diluted shares outstanding, both estimated by us, to arrive at what we think should essentially be a floor. We value TCDC Phase 1 using a stabilized NOI approach under a triple-net lease structure (~99% margin), assuming 133 MW of IT load, a 15-year base term, and ~45% NUAi ownership.

Across pricing scenarios of \$100–\$160/kW/month, this drives ~\$158–253M of total NOI and ~\$71–114M attributable to NUAi. Applying a 15x NOI multiple implies an enterprise value of ~\$1.1B–\$1.7B, and after assuming ~\$575M of project-level debt (80% financing), results in an equity value of ~\$492M–\$1.1B. On a per share basis (125M DSO) and discounted one year at 11%, our scenario analysis highlights a range of outcomes driven primarily by lease pricing. In a **bear case** at \$100/kW/month, we estimate ~\$3.55/share, reflecting ~\$492M of equity value. In our **base case** at \$120/kW/month, this increases to ~\$5.08/share, supported by ~\$705M of equity value. In our **bull case** at \$140/kW/month, we derive ~\$6.62/share, driven by ~\$919M of equity value, while a **super bull case** at \$160/kW/month implies ~\$8.16/share, supported by ~\$1.1B of equity value.

Source: NCM Research

TCDC Phase 1 + ½ of Phase 2 Floor Valuation

Valuation Framework (Phase 1 + Partial Phase 2). Expanding our framework to include TCDC Phase 1 (133 MW) plus ~50% of Phase 2 (150 MW), or ~283 MW total, and assuming a triple-net lease (~99% margin), 15-year term, and ~45% NUAJ ownership, we estimate ~\$336–\$538M of total NOI and ~\$151–\$242M attributable to NUAJ across pricing scenarios of \$100–\$160/kW/month. Applying a 15x multiple implies enterprise value of ~\$2.3B–\$3.6B and, after ~\$1.2B of project debt, equity value of ~\$1.0B–\$2.4B. On a per share basis and discounted over two years at 11%, this yields a valuation range of ~\$6.80–\$15.64/share, with our base case at \$120/kW/month implying ~\$9.74/share, a bull case at \$140/kW/month implying ~\$12.69/share, and a super bull case at \$160/kW/month implying ~\$15.64/share.

Revenue per kW per Month	Base Revenue	Avg. Annual Revenue	Avg. NOI per Year		NOI Multiple	Enterprise value	Project Debt (\$12M x 283 MW x 80% x 45%)	Equity Value	DSO	15x NOI Price	2-Year Discount Rate	Present Value

Management Team

E. Will Gray II — Chairman & Chief Executive Officer

E. Will Gray II serves as Chairman and CEO of NUAL and is a founding partner of the company. Gray brings extensive operating experience across the oil and gas sector, having held senior leadership roles, including CEO of Cross Border Resources and Dala Petroleum, as well as EVP of Resaca Exploitation. Since 2005, he has directly operated more than 950 wells across key U.S. basins, providing deep expertise in energy development and asset execution, particularly within the Permian Basin. Will received his B.S. in Business Management from Texas State University.

Charles Nelson — President & Chief Operating Officer

Charles Nelson serves as President and COO of NUAL, overseeing operations and infrastructure development. Nelson has experience developing and commercializing energy transition technologies and has overseen more than \$1B in infrastructure projects across power, fuel, and industrial platforms. His background includes aligning capital providers, corporates, and technology partners to scale complex energy and infrastructure systems, supporting NUAL's execution across its integrated power and data center platform. Nelson holds a B.S. in Chemical Engineering from Iowa State University.

Ted Warner — Chief Financial Officer

Ted Warner serves as CFO of NUAL, bringing nearly two decades of experience across energy, power, and digital infrastructure capital markets. Most recently, he led Northland Capital Markets' Energy, Power, and Digital Infrastructure practice, where he helped structure and manage over \$7B in financing solutions, including capital formation for data center and HPC infrastructure projects. His background spans investment banking, advisory, and prior CFO experience within a private equity-backed oilfield services company, positioning him well to lead NUAL's capital strategy. Warner holds Series 7, 79, and 63 licenses, a B.A. from the University of Michigan, Ann Arbor and an MBA from the Carlson School of Management at the University of Minnesota.

Valuation

Our price target of \$11.00 is based on a valuation of 283 MW of HPC at TCDC by 2030, assuming NUAL owns ~45% of the JV and has ~125M fully diluted shares outstanding.

Risks to the achievement of price target

Execution of Strategy – NUAL's transition from a legacy E&P business to a digital infrastructure developer introduces significant execution risk. The company has limited operating history in data center development, and its ability to successfully execute across site selection, development, construction, and commercialization remains unproven. Failure to execute this strategy could materially impact growth, timelines, and overall returns.

Development-Stage Business Model – NUAL is in the early stages of building its AI infrastructure platform and does not expect meaningful revenue generation until initial deployments begin, likely no earlier than 2027. The absence of operating history and revenue creates uncertainty around demand realization, project economics, and long-term profitability, particularly in a rapidly evolving AI infrastructure market.

Capital and Going Concern Risk – As of December 31, 2025, NUAL did not have sufficient liquidity to fund operations, raising substantial doubt about its ability to continue as a going concern. The company's business model is highly dependent on accessing external capital, and any inability to secure funding on acceptable terms could delay projects, constrain operations, or force strategic adjustments.

Tenant and Commercialization Risk – NUAL has not yet secured binding agreements with Hyperscaler tenants, and its development timeline is dependent on converting ongoing discussions into executed contracts. Delays in tenant onboarding would push out revenue generation, reduce visibility into project returns, and limit the company's ability to scale its platform.

Construction and Development Risk – The buildout of large-scale AI data center campuses involves complex engineering, permitting, and construction processes. NUAL may face delays, cost overruns, supply chain constraints, or operational challenges, particularly during early phases, which could impact project timelines, increase capital requirements, and affect its ability to attract customers.

Capital Intensity and Financing Risk – NUAL's platform requires substantial capital investment, with total development costs expected to exceed \$15B over time. The company's ability to secure project-level financing, equity capital, and other funding sources is uncertain and subject to market conditions, permitting outcomes, and project viability. Any shortfall in capital availability could delay or prevent project completion.

Macroeconomic and Market Risk – NUAL's access to capital and project execution are sensitive to broader macroeconomic conditions, including interest rates, credit availability, and investor appetite for infrastructure assets. Deterioration in market conditions could increase cost of capital, limit financing availability, and delay development timelines.

Counterparty and Credit Risk – NUAL is exposed to counterparty risk across both its legacy operations and future infrastructure model, including risks related to customer payment, financing partners, and contractual obligations. Any failure by counterparties to perform could impact liquidity, require replacement arrangements, and adversely affect financial results.

Legacy Asset Risk – NUAL's remaining legacy oil, gas, and helium assets carry inherent uncertainty related to reserve estimates, commodity pricing, and future monetization. The company intends to divest these assets, but there is no assurance of achieving favorable valuation or timing, which could impact liquidity and capital allocation.
