Company Overview

60 Degrees Pharmaceuticals (60P) is a growth-oriented biotechnology company developing new therapies for vector-borne diseases. The Company markets the FDA-approved antimalarial ARAKODA® (tafenoquine) and is advancing tafenoquine into new indications, including babesiosis, a tick-borne infection with no approved treatments. Clinical trial data from ongoing studies will be generated in the second half of 2026, after which the company will refine its strategy for an FDA regulatory submission.

Investment Highlights

ARAKODA® (tafenoquine) – Commercially Launched Antimalarial

- FDA-approved safe, long-acting, mechanistically differentiated anti-malarial, co-developed with U.S. Army
- 1,100+ patient exposures in 8+ published trials
- Commercially available in U.S. via network of major national distributors
- New 8-count bottle format launched June 2025 to expand market potential
- 2026 commercial expansion includes doubling inside sales capacity, enhanced digital marketing, a GoodRx partnership, and a new travel-focused telehealth channel via Runway Health

Advancing Tafenoquine for Babesiosis – a Significant Unmet Need

- No FDA-approved treatments currently exist for babesiosis
- Three clinical studies in babesiosis will yield initial data in late 2026
- Relapsing babesiosis highlights:
 - First patient tested negative for infection using a highly sensitive, FDA-licensed assay
- Study designed to confirm high cure rates in immunosuppressed patients with relapsing disease – remaining enrolled patients to completed study in March 2026 Company to set regulatory strategy in late 2026

Large and Growing Market Opportunity

- Initial estimate of U.S. babesiosis market was up to a maximum of 380,000 addressable patients annually
- Represents up to \$245M in potential peak annual sales and up to \$1.1B cumulative revenue through patent expiration in 2035

Seasoned Management Team and Board

- Profound clinical expertise in tafenoquine and related therapeutics
- Team has together led/managed six clinical trials
- Collectively led multiple pharmaceutical product approvals/ international pharmaceutical product launches
- Collectively led/provided guidance to multiple public & private entities
- Participated in/led multiple public listings

Buy ratings from Ascendant & H.C. Wainwright with \$17.60 median PT

Portfolio

Value Proposition

60P is addressing unmet medical needs in vector-borne disease through the development and commercialization of small-molecule therapeutics with established safety profiles. Building on its FDA-approved malaria prophylaxis ARAKODA® (tafenoquine), the Company is advancing tafenoquine into new indications, notably babesiosis, a rapidly growing tick-borne infection with no FDA-approved treatments.

In October 2025, 60P reported no Babesia infection detected in the first patient to complete therapy in its relapsing babesiosis study, an encouraging early signal supporting tafenoquine's potential to address this growing unmet need.

Initial research estimated the U.S. babesiosis market at up to a maximum of 380,000 addressable patients annually, representing up to \$245 million in peak yearly sales and up to \$1.1 billion in cumulative revenue potential through 2035. Supported by its existing commercial infrastructure and seasoned leadership team, 60P offers investors a capital-efficient path to expansion and meaningful upside potential in a high-growth vector-borne disease market.

60P is also testing the viability of developing Australian Chestnut Extracts as a botanical product for non-prescription use in the U.S. market, may seek to develop and license other molecules in the future.

On the commercial front, 60P is scaling ARAKODA® sales, with 2026 initiatives including expansion of the inside sales team, enhanced digital marketing, broader patient access through GoodRx, and a new travel-focused telehealth partnership designed to reach international travelers prior to departure.

About Babesiosis

- Tick-borne disease caused by protozoan parasites of the genus *Babesia*
- Invades red blood cells, causing:
 - Non-specific flu-like symptoms
 - Anemia
 - Death (1.6% mortality rate in hospitalized patients/10% in those with cardiac complications)
 - May be refractory to treatment in immunosuppressed patients
 - Hypothesized to prolong recovery time from chronic illnesses
- Common in Mid-West and Northeastern US
 - Geographic range expanding and incidence increasing
- Common coinfection with Lyme disease (10% of cases)
